We are pleased to announce a new venting option for our indoor condensing tankless water heaters (models ATI-240H, ATI-340H and ATI-540H). Until now, combustion air for these condensing models has been drawn from outside the building. These models can now obtain clean combustion air from properly vented rooms, therefore decreasing the installation time by reducing the number of venting runs and wall penetrations. To prevent debris from falling into the heater, we recommend that the installer insert a Schedule 40 PVC 90° elbow in the intake collar, as shown in the diagram below.

In addition to the new venting option, two stainless steel screens will be included with each DV model. These screens fit into 3" Schedule 40 PVC hub elbows and couplers to prevent debris from blocking the vents.
